

KUUJ FIREPRO™ EVAPORATIVE MEDIA

If you need adherence to fire codes, look no further than **FirePro.** This technology is made of flame retardant, inorganic materials fortified to provide you with the superior strength that is synonymous with Kuul® evaporative media. **FirePro** is designed to withstand the demands of even the toughest HVAC environment. Due to its unique material composition, **FirePro** has market-leading water absorption properties and saturation efficiency, which allows the product to rapidly respond to fast start-up conditions and changes in demand.

Kuul FirePro™ evaporative media is a premier line of specialized evaporative media that provides enhanced cooling performance and reduced pressure drop due to the choice of materials, design process and proprietary manufacturing technique. Only the highest quality materials are used and all components of this line are manufactured in our Center, Texas, United States manufacturing facility.

KUUL FIREPRO EVAPORATIVE MEDIAEVAPORATION EFFICIENCY AND PRESSURE DROP

- \cdot The performance data shown above is independently tested and verified by a third party under required, stringent testing conditions.
- Due to external factors including, but not limited to, installation practices, maintenance practices, water quality, humidity and ambient temperature, results may vary.
- The performance data shown above is based on wet media in optimal environmental conditions.

Kuul Custom Cassettes

Don't forget to add custom cassettes to your evaporative media. Evaporative media cassettes allow the media to safely travel without the threat of bent corners or warped edges. The cassette shields the edges with a strong layer of protection to ensure it arrives to the intended location in mint condition. Using customizable cassettes, clients can request the exact size to match their unique system specifications without the need to troubleshoot and cut the evaporative media themselves once it arrives. TECHNICAL SPECIFICATIONS AND DESIGN INFORMATION

Please refer to the table below for information surrounding design and final installation requirements.

Density of media	[lbs/ft³]	dry media = 1.29	wet media = 5.14
Water carrying capacity from dry to wet	[gal/ft³]	0.617	
Maximum air velocity of media before carry-over	[fpm]	700	
Maximum air velocity of media using DE	[fpm]	800 (If greater consult Kuul Support)	
Maximum height of a single piece of media	[in "]	78.75	
Maximum system height per single header	[in "]	100 (If greater consult Kuul Support)	
Recommended supply water over top media surface area	[gal/min/ft2]	1.5 (consult Kuul if system is > 100" in height)

MAINTENANCE AND UPKEEP

FirePro media has been designed with superior wet strength and chemical stability. The following recommendations pertain to recirculating water in the system. The system should be controlled to prevent any of the following parameters from exceeding the listed value.

These guidelines are only valid for Kuul media. It is the responsibility of the design engineer and/or the system operator to evaluate if other system components have more strict limits for any of the parameters.

PHYSICAL AND CHEMICAL PARAMETERS		
Parameter	Guideline (unless otherwise agreed)	
Total Alkalinity (mg/L as CaCO3)	Less than 250	
Calcium Hardness (mg/L as CaCO3)	Less than 250	
Chlorides (mg/L)	Less than 400	
Conductivity (uS/cm)	Less than 3000	
Dissolved Iron (mg/L as Fe)	Less than 1	
pH (SU)	6.5 to 8.5	
Silica (mg/L as SiO2)	Less than 100	
Sodium (mg/L)	Less than 400 ²	
Suspended Solids (mg/L)	Less than 20	
BIOCIDES		
Free Chlorine (mg/L as Cl2) -Continuous -Periodic Shock Doses	0.5 to 2.0 Less than 7	
Hydrogen Peroxide -Periodic Shock Doses	See Maintenance and Service Guide	
DBNPA (Continuous & Periodic Shock Doses)	Compatible	
Isothiazolone (Continuous & Periodic Shock Doses)	Compatible	
Bronopol (Continuous & Periodic Shock Doses)	Compatible	

Notes: The values listed are provided in the absence of process data such as water temperature and run hours per year and are not adjusted to consider interactions between parameters. Please consult with Kuul Engineering for a project-specific water chemistry evaluation or if any of the listed limits are projected to be exceeded.

If sodium form ion exchange (water softening) is employed the sodium levels will increase as hardness is removed. The increased sodium levels must be accounted for if this treatment process is employed.

It is not recommended to use unblended RO, DI, or softened water with the media. Enough feedwater should be blended with the RO, DI, or softened water to allow for slightly scale dissolving water at design concentration.

• For system design advice, please contact Kuul Support for optimum choice. Kuul is devoted to sourcing superior materials and manufacturing with the highest quality standards as well as ongoing product development. For current performance data, contact your Kuul® evaporative media expert.
